E-portfolio Reflection

Discussions 1 and 2:

During the discussion posts I had to write a post about the specified task. Discussion one was to discuss the internet of things and critically evaluate it including the risks and challenges. Discussion 2 was to compare the rules of GDPR.
All students then had to respond to each others posts focusing on the measures used to prevent the incidents highlighted. The discussions were aimed at helping me to identify and manage challenges, security issues and risks and also limitations.
This task was quite easy to research and find the information I needed so I was quite happy about that. It was only a 200-300 words paragraph so it was easy to summarise into that many words as sometimes I struggle to talk about something with lots of words. This task was good because during the discussions with other students I usually learn more than what I wrote and therefore develop more of an understanding about the task. During these discussions though not many students responded to each other so there wasn't much of a discussion. I believe this happened because it wasn't a marked task students tend to forget about it or put it off and concentrate on the marked assignment. I believe if this was made mandatory like the other module discussion the students would have a more open discussion about the task and therefore respond to each other.

Unit 6 assignment:

This assignment involved working as a group, so I worked with two other students and we had to design and build a logical database. This assignment was quite a challenge for me, it took a lot to be able to understand what I had to do but working with a group made it easier as we had lots of discussions and this enabled everyone to share their thoughts and what they knew so they were able to help me. At the end of the assignment I was confident in the database and gained lots of knowledge from this assignment. The trouble with working as a group during this assignment was the time difference with the other two students and we are all from different time zones so setting up meetings to discuss the assignment was a challenge but we always managed to make it work. I think having group assignments with an online course and students in different countries

wouldn't work as well as if they are all together in a lecture hall. If I was to do this assignment again I would have more involvement in the actual database design because this is where I struggled most.

Unit 7 normalisation task and relational database design:

During this task I had to convert the table of information given into 1NF, 2NF and 3NF. Once the table was in 3NF I had to create a relational database showing the links between the tables.
I struggled with this task, after watching lots of tutorials of others doing it I finally managed to figure it out. This task was very stressful and I thought I couldn't do it, but once I did it I now have a huge understanding of it and more things from other tasks I am now able to understand easier. I don't think there was enough during the module to enable me to fully understanding this task, but after doing my own research I am now competent in it. If I was to do this task again I would definitely do my research and gain some more understanding first before attempting the task.

Unit 10 API security requirements:

During this task I had to evaluate the security requirements of an API. Before starting this task I was unaware of what API was, so after some research I found lots of useful information. I was worried about this tasks as I wasn't sure I was researching the correct thing. This task was very interesting and good to learn. If I already knew a little about API I think this task would have been easier for me to complete, but after completing the task I now have an understanding of API. If I was to do this task again it would be good to have discussions with other students to gain a better understanding from other students views.

Unit 11 executive summary:

This assignment was continued from unit 6 group work on the database design but this assignment was an individual task. During this assignment I had to produce an executive summary to pull together the recommendations and conclusions of the database. I felt confident

pulling all this information into an executive summary because we had already built the database I just had to justify why it was great for the company. The bad thing about this assignment was that because the first part was group work there was some sections I didn't do so writing about it was a little bit confusing in some sections. If I was to do this assignment differently I would make sure I had a part in every step of the group project so I knew everything about it in the write up.

Unit 12 e-portfolio reflection:

During this assignment I had to create an e-portfolio and put all my work during this assignment into it, and then write a reflection about all the work I did. Creating the e-portfolio was difficult because I haven't created an e-portfolio before so I struggled but after research I managed to figure it out. This was a good assignment because writing the reflection made me understand what I struggled with during this module and it was good to be able to know how to create an e-portfolio. If I was to do this assignment again I would have practiced making my e-portfolio earlier in the module so when it came to making my actual e-portfolio It was much easier. I would have also started my e-portfolio sooner to give me more time to complete it instead of rushing the end.
